

Standards

There are a number of standards specific to the risk process as well as some that mention or encompass risk in some way. The major ones will be discussed in this section.

Open FAIR is a standard produced by the Open Group – who have a long and illustrious history as the certifying body for the UNIX trademark – although nowadays it is far better known for its work in enterprise architecture – certifying both the TOGAF architecture examination and the ArchiMate software tool.

FAIR is an acronym for "Factor Analysis of Information Risk" (Josey et al, 2014). It consists of two documents, the open risk taxonomy (O-RT) which defines the taxonomy for the factors driving information risk; and the open risk analysis (O-RA) which describes the process and procedures associated with performing risk analysis.
